Maximo Mobile app UX Audit

Onboarding

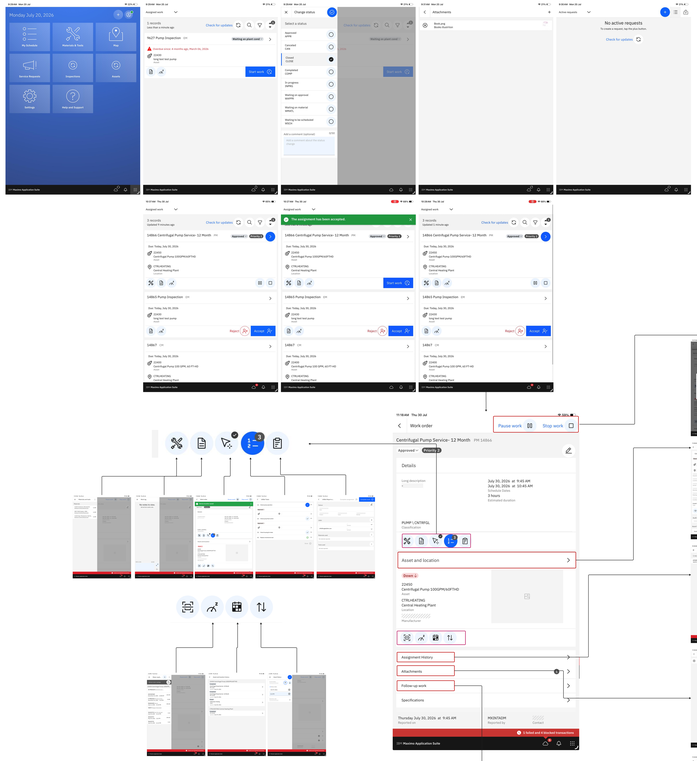
Navigation is easy to learn.	Product terminology assumes domain knowledge.	Users can find features quickly.	Users may not understand the purpose of features immediately.	Empty states do not guide next actions.	Help & Support is too technical for most users.	Workflows are functional but not strongly task-oriented.

My Schedule

quickly find my next job
understand what needs doing
access any relevant information, complete the work, and move on to the next task.

01	02	03	04	05
Landing on My Schedule **What the User Wants** • See today's jobs • Understand priorities • Know what to work on next • Start work quickly	**Selecting a Work Order** • Understand the job • Confirm they're opening the correct task • Decide whether to start work	**Reviewing Asset & Location** • Verify correct asset • Confirm location • Understand context	**Attachments & Documentation** • Access manuals • Review supporting documents	**Completing work** • Access manuals • Review supporting documents

Painpoints

Opportunities


What works	What could be improved	Why it matters	Severity
Assigned work is immediately visible.	Work items do not strongly highlight priority or urgency.	Users may struggle to identify what requires immediate attention.	Medium
Status update flow appears straightforward.	Large status list requires users to scan multiple options.	Decision-making takes longer than necessary.	Medium
Attachments are easy to access.	Relationship between work order and attachment is not immediately obvious.	Users may not know whether attachments are required before completing work.	Low
Empty state clearly indicates there are no requests.	Empty state provides no next step.	Creates a dead-end experience.	High
